Hervik's comments on my criticism of the paper of Jaffe et al are irrelevant or wrong.

Jaffe et al [1] performed recently the fit of WMAP data based on the work of Barrow et al [2]. They claim [1] the existence of the nonvanishing vorticity and shear of the Universe. The spacetime vorticity [3] in the model [2] vanishes by definition, and this was the statement in my comment [4]. The spacetime vorticity vanishes even after the introduction of the angle of tilt that induces fluid vorticity [5]. However, the model discussed in [2] contains vanishing angle of tilt, thus also vanishing fluid vorticity. Barrow et al [2] define their own "vorticity", with unclear physical notion and relevance.

The correct treatment of perturbations in General Relativistic cosmology beyond FRW models is introduced and discussed by Ellis and Bruni [6], few years after paper of Barrow et al had been published. One cannot work properly in the model beyond FRW, and then assume during some derivations "FRW background" [7]. The gauge noninvariant formulae are the source of the embarrassing results of Jaffe et al [1]: extremely small shear beyond one-year WMAP data sensitivity.

SAPIENTI SAT.
